A fuel is a material that is burned in order to get heat and light and, also to generate power. The process of burning is a chemical reaction. There are many different types of fuels and actually that burns can be called a fuel. But the most common fuels are wood, coal, natural gas and petrol. Fuels can also be classified as solid, liquid or gas. Wood was one of the first fuels used by man, and was his most important one for many centuries. It was the easiest to get, and the cheapest. But during the sixteenth century, wood started to become scarce in Europe, and coal began to replace it. Coal contains high percentage of carbon. Carbon is the most important part of most fuels. Q1. Read the passage given below and answer the following questions.

1. The Moon is a satellite of the earth. What is a satellite? Any heavenly body revolving round a planet is its satellite. Man has created artificial satellite which revolves around the earth. These satellites are used for various purposes, Have you ever wondered what happens to the satellite that have outlived their usefulness and have been abandoned'?

2. These artificial satellites keep orbiting the earth. If they are orbiting at a height of about 400 km or less, they lose velocity in course of time due to friction with dust particles. They gradually spiral towards the earth and bum up when they enter the atmosphere. Sometimes, some pieces hit the earth at a height of thousands of km. They may continue in their orbits lot thousands of years.

3. Satellites have electric transmitters that send signals to the earth. So, once they have completed their mission and are about to be abandoned scientists switch off the electronic transmitters. This is done to prevent the signals from disrupting transmissions from other satellites.

4. Many countries have put their satellite in space for better telecommunication purpose, The International Telecom Union would like all satellites that are low down to be pushed up before they are abandoned, so that they may not fall back to the earth. But this is hardly done, because the satellites have lost control over it. Man has created many space wonders which orbit the earth for many years. Some of these fall back to the earth while others continue their wandering.

- (a) What is satellite?
- (b) What is an artificial satellite?
- (c) What happens to those satellites that have outlived their usefulness?
- (d) Why have different countries put their satellite up in space'?

Q1. Read the passage given below and answer the following questions.

1. The Moon is a satellite of the earth. What is a satellite? Any heavenly body revolving round a planet is its satellite. Man has created artificial satellite which revolves around the earth. These satellites are used for various purposes, Have you ever wondered what happens to the satellite that have outlived their usefulness and have been abandoned'?
2. These artificial satellites keep orbiting the earth. If they are orbiting at a height of about 400 km or less, they lose velocity in course of time due to friction with dust particles. They gradually spiral towards the earth and bum up when they enter the atmosphere. Sometimes, some pieces hit the earth at a height of thousands of km. They may continue in their orbits lot thousands of years.
3. Satellites have electric transmitters that send signals to the earth. So, once they have completed their mission and are about to be abandoned scientists switch off the electronic transmitters. This is done to prevent the signals from disrupting transmissions from other satellites.
4. Many countries have put their satellite in space for better telecommunication purpose, The International Telecom Union would like all satellites that are low down to be pushed up before they are abandoned, so that they may not fall back to the earth. But this is hardly done, because the satellites have lost control over it. Man has created many space wonders which orbit the earth for many years. Some of these fall back to the earth while others continue their wandering.

- (a) What is satellite?
- (b) What is an artificial satellite?
- (c) What happens to those satellites that have outlived their usefulness?
- (d) Why have different countries put their satellite up in space'?
- (e) What is the use of transmitter in satellites?
- (f) What happens to those satellites that are orbiting the earth at a height of thousands of kilometers?

Q.2. Read the passage carefully and answer the questions that follow:

Read the following passage carefully.

(5 marks)

Yuri Gagarin, the first man to travel into space, was born in 1934. He was the son of a village carpenter who lived near the city of Smolensk in Russia, and Yuri attended the local school. When he was old enough, he joined the Soviet Air Force and trained as a pilot. He qualified as a jet-aircraft pilot, and was then promoted to the rank of Major.

After the end of the Second World War, the Russians became very interested in the possibility of travelling into space, and they launched several rockets which went round the Earth above the top of the air. The Earth is surrounded by air, but this air does not stretch upward for more than a few hundreds of miles, and above a height of only about ten miles the air is so thin that no ordinary aircraft will fly in it. To go higher, it is necessary to use a rocket, which will work excellently even when moving in outer space. The first rockets sent up into space carried no crew but only scientific instruments; the next carried animals; and when these animals were brought back safely to earth, the Russian scientists were ready to send up a man. They chose Major Yuri Gagarin to be the first pilot. On April 12th, 1961, his space-ship, the Vostok, was ready, and the great adventure began.
